

MetaConnector for Lotus Domino

Real-time Storing and Retrieving
of your documents

REAL-TIME STORING AND RETRIEVING OF YOUR DOCUMENTS

MetaConnector for Lotus Domino provides an online archiving solution which supports intelligent caching strategies for fast store and retrieval of Lotus Domino data, e.g. mails, attachments, databases, HTML and Rich Text objects. It also provides recovery functionality for the entire Notes database in the disaster case. MetaConnector for Lotus Domino is easy to configure and to maintain and there is no need for any change of existing applications. It operates in the background, invisible for the user and integrates seamlessly into existing Lotus Domino server installations.

- Online archiving solution for fast store and retrieval of Lotus Domino data
- Easy configuration
- Disaster recovery for complete Lotus databases
- Revision management for modified Lotus Domino data
- No change of existing Lotus applications
- Full support of DominoDoc and other standard Lotus applications

STORAGE COMPONENTS

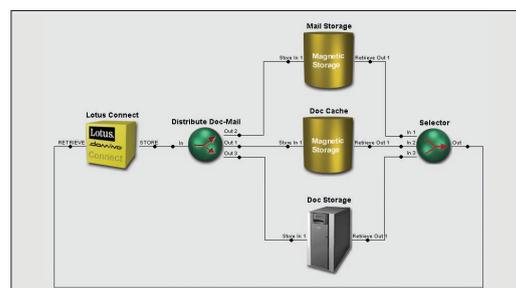

MetaConnector for Lotus Domino supports - completely independent from the Lotus administration - all storage components which are offered by the used archive. Any kind of magnetic or optical systems that can be distributed in an enterprise wide environment are considered. Using a Compaq archiving solution, the Administration Center can be used to configure your archive scenario and the integration of your Lotus Domino servers.

EXAMPLE CONFIGURATION

Using a Compaq archiving solution, all components are distributed and allow scalable enterprise wide groupware and archiving solutions. Different archiving scenarios such as mirroring and document migration are supported. Additional information is stored in conjunction with each Lotus document. These attributes can be used later on to distribute the data within the archive, to merge the data or to separate the documents to different storage media. Please ask for other supported archiving solutions which are

compatible with MetaConnector for Lotus Domino.

- Archive OpenAPI support
- Graphical configuration
- Supports one or more Lotus Domino servers
- Several Connectors can be used in one archive scenario
- Integrates into an existing Archive environment
- Corporate-wide data distribution

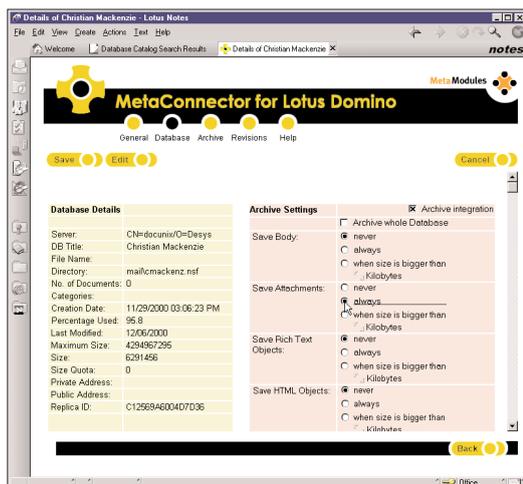

INSTALLATION

A simple installation procedure is delivered for your Domino server. The setup process instantly detects your environment and installs the MetaConnector for Lotus Domino in the specific directories on your machine.

METACONNECTOR FOR LOTUS DOMINO CONFIGURATION DATABASE

A Lotus Notes based administration environment is used to configure the databases that are monitored by the MetaConnector. An individual configuration is possible for each database. You can obtain an overview of your databases on the local Lotus Domino server to check the archive integration status of all databases instantly. To handle a large amount of databases

with same archive configurations (mail accounts), it is possible to copy a configuration to a selected group of databases.

By specifying objects and their attributes the administrator can determine what will be archived. These objects are mail bodies, rich text, attachments or MIME type items. It is possible to store them by default or by defining a minimum size. Also for each database a period of time can be scheduled that determines how long the specified objects stay at least in the Lotus Domino server until the next archiving process stores it into the archive and removes them from your Lotus Domino database.

REVISIONING

If the revisioning option for a database is enabled, a modified note will be stored automatically as a new revision. The MetaConnector takes care of the revision management and allows the administrator to retrieve earlier revisions of a note.

THE LOTUS DOMINO SERVER EXTENSION

The Lotus Domino server extension recognizes every read access to a note located in a configured database and restores the archived note before the Lotus Domino server passes it to the requesting application. This mechanism is completely independent and supports every application that interacts with a Lotus Domino server without the need for any modification.

MetaConnector for Lotus Domino Requirements

Product Name: MetaConnector for Lotus Domino

Version: 1.3

Functional description: Lotus Domino server extension
MetaModules Server
MetaConnector for Lotus Domino

Lotus Domino Version: 5.0

System Requirements: Lotus Domino server V5.0 for NT
Supported document archiving solution (NT/Unix)
